

Wired Headsets

PREVENTIVE MAINTENANCE

- ▶ Leave headsets plugged in at all times. To prevent broken wires and damage to inner components, make sure the crew does not twist and turn connector.
- ▶ The connector fits into the belt pack one way. Do not force it to fit any other way.
- ▶ Mic booms, for most headsets, do not rotate in a complete circle. Mic booms that have been forced to rotate in a complete circle without that function will be deemed non-repairable.
- ▶ Keep ear pads on to protect the speaker and the ear to prevent debris from gathering on speaker.
- ▶ If your model requires a mic muff, keeping this on will prevent muffled and distorted speech along with keeping dirt and debris out.
- ▶ Don't let the headset cable hang loosely. Attach one clip to your collar and another to the back of your shirt.
- ▶ A cut or tear in a headset cable may or may not be repairable. For some headset systems, this cable cannot be repaired.
